

Working Prototype Known Problems Report

Sluggo iOS, Sluggo Team, June 2nd 2021

List of functions not working correctly:

- Pop-ups for delete confirmation, specifically the delete confirmations on tags and tickets, have constraint errors of unknown origin associated with them, which is thrown by the advanced debugger. A possible way to remove this fault is to programmatically constrain the pop-up before it is displayed.
- At app launch, a TableView warning pop-ups in the console log, which warns of possible bugs with the way the view hierarchy is managed. We believe this bug to be located with how we manage our sidebar, and would require a redesign of how the sidebar works to get to work correctly.
- The login page is not a scrollview, which can cause issues with dismissing the keyboard when trying to select the login button. This would require a redesign of the login page.
- Errors are caught, but most error messages will be generic HTTP error messages, with only the most common user errors having non-generic error messages.
